

Abstract of the Disclosure

A method that enables an owner or an operator of a well to manage workers that are performing various service operations at a remote well site. The method involves a wireless communication link that allows one computer at a home base location to communicate with a mobile computer associated with a service vehicle at the well site. Workers of several independent contractors enter employee data into the same mobile computer to indicate who is at the well site. Transducers associated with various service operations feed electrical signals into the computer along with a time stamp, which helps confirm that a worker is actually working at the well site. An owner or operator of the well can then access the information using the home base computer and the wireless communication link to help determine who is working at well site, what they are doing, and when they are doing it.
